

In general, please note when planning and installing:

- The respective BirdBlocker installation instructions must always be observed (included in every BirdBlocker box or please download from our homepage). We will also be happy to send them to you on request.
- The installation of the BirdBlocker should only be carried out by specialists and companies with experience in the installation of solar systems on roofs.
- The executing installer and installation company is responsible not only for the professional installation of the BirdBlocker, but also for the roof and the solar system on which it is installed. The installation instructions do not release the executing company from the obligation to clarify in advance the possible uses and applications of our products in conjunction with the other materials and products used on the individual object.
- The processing instructions, regulations and warranties of all manufacturers and trades involved must be observed. If technical details are not described separately, this does not release the executing company from checking in each individual case and clarifying a technically correct issue beforehand.
- The suitability of the BirdBlocker for the intended use in the solar installation is checked by the owner and the installation company themselves. BirdBlocker is not a 100% protection against the nesting of birds or against other animals under the solar installation. However, due to its construction, BirdBlocker strongly disturbs and hinders birds and other animals trying to get under the solar installation. BirdBlocker works best as a preventative measure to prevent bird nuisance.
- It is important that the BirdBlocker is installed in a closed manner around the perimeter and that the needles of the BirdBlocker are stable on the roof surface to provide resistance. Suitable module frames are those that have an inner flat profile with frame thicknesses of 1.2 - 2mm, to which the BirdBlocker strips can be easily and permanently mounted in a stable manner using the stainless-steel fastening clips.
- Before installing the BirdBlocker, old nests and other dirt under the solar system should be removed. Do NOT install the BirdBlocker during the breeding season. Birds will do their utmost to get under the solar panels because of their nesting urge. If nests with eggs or young birds are present, the respective animal protection laws must be observed and if necessary the veterinary office must be called in beforehand. In several countries it is even punishable by law to disturb the birds during the breeding season.
- It must be ensured by the specialist company responsible for the installation prior to installation that the installation is carried out strictly in accordance with national and site-specific building regulations, occupational safety and accident prevention regulations, standards and environmental protection regulations and the respective animal protection laws. Each company and person installing the BirdBlocker is obliged to inform themselves independently about all rules and regulations for technically correct planning and installation and to comply with these during installation. This also includes obtaining the current status of rules and regulations.
- In the case of non-observance of the installation instructions and in the case of use and combination of further components which were not purchased from us, we shall not assume any liability for resulting defects and damage. The warranty is excluded in this respect.
- The information given and drawings and photos shown in our documents and on our homepage serve to clarify individual details and are merely recommended information. RoofTech GmbH and the BirdBlocker manufacturer accept no liability whatsoever as a result.
- RoofTech GmbH and the BirdBlocker manufacturer do not accept any responsibility for suitability, effect, installation and correct use.

Further information and the individual installation instructions can be found on our homepage: www.rooftech.de.

We would also be happy to send you the respective installation instructions and further information.

We look forward to receiving your message or call.
